### *Abstract*

This study reports a content analysis of 35 World Wide Web sites that included in their mission engaging girls with information and communication technology (ICT). It finds that sites emphasize cultural and economic uses of ICT, doing little to foster civic applications that could empower girls as citizens of the information age. The study also finds that sites foster a narrow range of ICT proficiencies, focusing mostly on areas such as communication, in which girls have already achieved parity with boys. An examination of the role models portrayed in ICT occupations indicates that the sites show females mainly in elite technology jobs, reversing stereotypical mass media depictions of females in low-status roles in relation to ICT. Employing an original index of ICT knowledge and skills, the study finds that the sites that scored highest both on fostering comprehensive knowledge and skills as well as featuring civic content were general interest web communities. Ownership (for-profit or not for-profit) of sites was less important than editorial control: sites that offered girls a place to contribute their own content were more likely to offer civic material and a broader range of ICT knowledge and skills. We conclude with recommendations for web site designers to rethink their design strategies and their rationales for closing the gender gap in computing.

## Introduction

The gender gap in the US information and communication technology (ICT) work force has widened in the face of efforts to close it. The proportion of women in ICT jobs declined from a high of 41 percent in 1996 to 32.4 percent in 2004, and women still hold only 25.4 percent of professional or management positions in these fields. Women's share of undergraduate degrees in computer science and engineering failed to grow from 1999 to 2004, holding steady at approximately 22 percent (Information Technology Association of America, 2005). Harvard President Lawrence Summers' widely-publicized remarks that women's lesser rates of leadership in scientific and technical fields stemmed in part from a lack of "innate ability," and the stormy reaction he provoked, have dramatized the continuing educational and occupational gender differences in math, some sciences, and engineering, including computer engineering (Begley, 2005).

From the late 1990s onward, many organizations created World Wide Web sites to boost girls' confidence with ICT and girls' interest in pursuing ICT-related careers. These efforts have attracted significant media coverage as well as corporate, foundation and government funding. This study analyzes US-based web sites that included in their mission engaging girls with computer-related ICTs. Although a content study cannot establish whether these sites are successfully closing the gap in computing, such a study can tell us what kind of material sites attempt to introduce girls to online. We show the scope, as well as the limits, of what the sites teach about the uses of computers and related media, the types of ICT knowledge and skills that the sites foster, and the range of ICT occupations that are represented.

The study makes several contributions to our understanding of how the gender gap is conceived and represented. First, despite the importance of the issue for public policy, we have found no systematic analysis of how these sites represent ICT in the literature, nor of other media examples aimed at engaging girls with ICT. Second, we propose and measure the presence of a new index of ICT knowledge and skills, synthesized from the literatures on education for ICT literacy and civic engagement. Third, our findings not only provide a basis for rethinking the design strategies of these web sites to close the gender gap more effectively, but also encourage us to rethink our rationale for closing the gap itself by focusing not simply on economic and cultural reasons for girls to engage with ICT, but civic ones.

## Literature Review

### *The Gender Gap and ICT*

Technologies are often designated as falling primarily in masculine or feminine domains of use and expertise, although the gendering of technologies may change over time as marketers reposition them or users appropriate them for new purposes (Wajcman, 2004). The computer, especially its design and programming as well as its use for recreational purposes such as gaming, was initially gendered male (Kiesler, Sproull, & Eccles, 1985; Turkle, 1988). So too was the early culture of the Internet, which was presented in the news media as a hostile place for women because of the prevalence of

aggressive communication in bulletin board systems, pornography, sexual harassment and cyberstalking (Edwards, 2005).

However, as computers have become connected to the Internet in large numbers, and so have become more useful for communication, some cyberfeminists have claimed that the technology now promises to deliver liberation, power and pleasure to a new generation of women users, led by youthful “cybergrrrls” who have grown up online (e.g., Plant, 1998). In this view, women’s abilities are advantaged by the new technoculture and workplace because they reward intelligence more than physical strength, democratic more than autocratic leadership, interpersonal skills, independence and flexibility. Indeed, some historic differences in boys’ and girls’ uses of, and attitudes toward, computers appear to have disappeared. Men and women entering college report that they use computers frequently in almost equal numbers (Higher Education Research Institute, 2001). Women have gained parity with men in time spent using the Internet, with teenagers accounting for the fastest growing segment of women users (Horrigan, 2000). Females’ use of the Internet for communication now equals or outstrips males’ in several ways. Women are more likely to use email to keep in touch with family members (Boneva, Kraut, & Frohlich, 2001). Girls aged 15-17, with strong needs for communication and social interaction, spend more time online than boys of the same ages and are more likely to use email, instant messaging, and text messaging via cell phones (Lenhart, Madden, & Hitlin, 2005; Valkenburg, 2004). The new generation of online interactive games appears to be drawing more female players than older computer and video console games (Graner Ray, 2004). A recent national survey found that 76 percent of girls who use the Internet have played on online game, compared with 86 percent of boys, although this does not necessarily mean that girls who play these games do so as frequently as boys (Lenhart, et al, 2005). Another recent nationwide study of youths aged 8 to 18 confirms many of these trends (Roberts, Foehr, & Rideout, 2005). Researchers found no differences between boys and girls in their likelihood of being on the computer on a given day or the amount of time spent on the average day. However, the typical computer activities of boys and girls did vary: Boys were more likely to play games, while girls were more likely to use the computer for e-mail, instant messaging, and visiting websites. In addition, adult women continue to be well-represented in media production jobs, including digital content creation (Preston, 2005).

However, other gender differences in attitudes and uses persist. Recent studies of elementary and middle school children (Bruckman, Jensen, & DeBonte, 2002) and high school students (Barron, 2004; Colley & Comber, 2003) find girls still report less experience in computer programming. Girls also continue to express less confidence in their computing and internet abilities (Ames, 2003; Bunz, 2005; McIlroy, Bunting, Tierney & Gordon, 2001; Messineo & DeOllos, 2005; Torkzadeh & Van Dyke, 2002; Young, 2000). In addition, girls still demonstrate less interest in computers (American Association of University Women, 2000; Vale & Leder, 2004). The gaps in programming experience, confidence and interest are also found between females and males enrolled in American university computer science and applied information technology majors (Ogan, Herring, Ahuja, & Robinson, 2005). These differences are also found in Europe and Australia (for a review of this research, see Littleton & Hoyles, 2002). Women have been more likely to view the computer as a tool to accomplish tasks rather than an object of interest to be explored in its own right. Thus, females have been

more likely to use computer applications for word processing, graphic design and communication instead of tinkering, play, programming or systems design (American Association of University Women, 2000; Jackson, Ervin, Gardner, & Schmitts, 2001; Odell, Korgen, Schumacher, & Delucchi, 2000; Scealy, Phillips, & Stevenson, 2002; Shaw & Gant, 2002). Furthermore, as noted at the beginning of this article, women remain scarce in ICT hardware and software design and engineering in the US, and in the higher degree pipelines that lead to these fields. Conversely, women remain highly over-represented in low-level ICT jobs in the US, where they comprised 80.3 percent of data entry keyers and 93.6 percent of word processors and typists in 2003 (Preston, 2005, p. 15).

The persistence of some elements of the gender gap in ICT uses and attitudes underscores the importance of studying efforts to promote girls' interest in and uses of ICT, such as the web sites examined in this study. Given the changing nature of the gap, it is important to examine whether these web sites aimed at involving girls with ICT are addressing continuing disparities in uses and attitudes toward the technology or ones that are disappearing.

### *Uses of ICT*

In the literatures on the gender gap in computing and ICT literacy arguments for pursuing greater equity among males and females in ICT attitudes and uses are most often based on economic, cultural, or civic rationales (Raphael, 2002). These arguments need to be reviewed because each calls for a different kind of digital content aimed at closing the gender gap, which has implications for whether web site designers should foster visitors' economic, cultural or civic uses of ICT on their sites. Indeed, each rationale suggests a different kind of gender gap that needs closing. These rationales also require some definition because the question of *why* we should seek to address gender inequalities is so infrequently examined in public discourse, which has been dominated by economic concerns.

Economic arguments for equality in ICT use stem from liberal feminist concerns about gender equity in schooling and the workplace (e.g., Furger, 1998) and industry demands for more trained employees (e.g., Information Technology Association of America, 2005). From this standpoint, closing the gender gap is primarily about equalizing women's opportunities to secure high-paying ICT work and secondarily about the social benefits of increasing females' control over technical design. This position often leads to calls for software and web sites that feature women role models or mentors in the technical professions or that engage girls' interest in careers in the field. It is hoped that this strategy will counteract many girls' image of technical work as masculine, dull, sedentary and anti-social, drawing more females into the educational pipeline toward higher degrees and jobs in computer science and engineering (American Association of University Women, 2000; Cooper & Weaver, 2003).

Cultural arguments for equity focus on increasing females' opportunities to use technology to explore and express their identities, create and communicate, and maintain relationships. From this point of view, the gender gap is primarily a problem of unequal access to communication and play in the public and private spheres. The emphasis here is often on ensuring girls have entertainment content, such as computer games, that suits

their interests (Cassell & Jenkins, 1998), as well as opportunities for girls to have access to online communication and to create their own digital content via new media (Mazzarella, 2005). These arguments emerge mainly from scholars influenced by cultural studies and women game and web site designers (e.g., Graner Ray, 2004). As noted above, this aspect of the gender gap appears to be closing in several ways as more women use ICT for communication via email, instant messaging, and text messaging, and continue to play a significant role in media production careers.

Civic arguments for equity stress the need for women to be fully informed and enfranchised citizens of the information age. This approach suggests that girls and women need to be able to use ICTs because they are increasingly important tools for engaging in civic life. It also maintains that females need to know how technology works to participate equally in designing, implementing and regulating digital hardware, software and content. From the civic standpoint, girls also need to know how computers work, both their capabilities and limits, to develop personal and public codes of technology ethics, law, and policy. Girls need to develop critical thinking and ethical reasoning skills both *with* computers and *about* them. The civic rationale surfaces occasionally in policy discussions about technology in education (e.g., National Research Council, 1999; Alliance for Childhood, 2000) and more frequently in accounts of how women's civil society organizations are using the Internet as a space to organize for social change (Harcourt, 1999; Shade, 2002; Youngs, 2001).

Preparing girls for civic uses of ICT also appears urgent in light of widespread concerns about the civic disengagement of youth in general. Compared to prior generations of young people, today's youth express less interest in politics (Galston, 2004), are less likely to say that they trust their fellow citizens (Keeter, Zukin, Andolina, & Jenkins, 2002), and are less likely to define citizenship as involving duties (such as voting or donating money) and not simply rights (Kurtz, Rosenthal, & Zukin, 2003). Research on youth Internet usage offers some hope for the potential of new media to assist in re-engaging the young. Young people's introduction to the Internet coincides with a key moment in their political socialization. At the same time that almost all American youth are getting online they are forming the political habits and views that will shape them as adults (Torney-Purta & Amadeo, 2003). Not only are 94 percent of youth now online by twelfth grade, but they begin spending more time online and using the Internet in more ways on a regular basis during their teenage years, including for news and political information (Lenhart, et al, 2005). For youth, the Internet can provide a "free space" for low-risk exploration of civic identities and alternatives to mainstream views across geographical and social group boundaries (Flanagan & Gallay, 2001).

The literature suggests that web sites can make a contribution to equity by representing or featuring activities that foster girls' economic, cultural or civic uses of ICT. Because these uses have been emphasized differently in multiple branches of the literature, it is important to know whether sites are encouraging these uses equally, or whether some uses are neglected. In addition, because girls and women appear to have made the greatest strides in cultural uses of ICTs, ongoing emphasis on the cultural seems to be less of a contribution toward closing the gender gap than a focus on economic or civic uses might be.

*ICT Knowledge, Skills, and Occupations*

Digital media that aim to engage youth with ICT can be evaluated as well by examining what knowledge and skills necessary for ICT fluency are represented or fostered through activities in these media. There have been several attempts to define educational standards for ICT literacy in the US (International Technology Education Association, 2000; National Academy of Engineering, 2002; National Research Council, 1999). It would not be feasible to assess whether sites address every type of skill and knowledge mentioned in the literature because these would be too many categories to operationalize. However, five overarching types of knowledge and skills may be synthesized from this literature, including (a) a grasp of the technical aspects of ICT (hardware, software, tinkering and troubleshooting); (b) the social-ethical aspects (including such issues as civility, privacy, and intellectual property); (c) productivity-multimedia (such as presentation and web authoring software); (d) communication (including instant messaging and listservs); and (e) research (such as how to search for and evaluate information on the Internet). A full list of our categories appears in the Methods section below.

Yet the literature on ICT literacy standards fails to reflect fully the technology's potential civic uses. Therefore, it is important to supplement this definition of core ICT knowledge and skills with categories from the literature on standards for, and effective practices in, education for civic engagement (Kahne & Westheimer, 2003; National Assessment of Educational Progress, 1998). This literature suggests several broad types of knowledge and skills for using ICT effectively as well, including for civic problem-solving and decision-making, project-based learning about civic issues, simulations of public life, opinion expression, deliberation, participation, and a grasp of the regulation of ICTs themselves. Examining the extent that sites portray and foster a broad range of these kinds of knowledge and skills can indicate how successfully they are fulfilling their missions to develop girls' engagement with the technology.

In addition, many of the sites include information about ICT-related careers and female role models in them. The range of occupations represented on the sites is another indicator of their breadth of vision of the ICT field, as well as of their ability to overcome the legacy of mainstream media's stereotypical representation of women in relation to ICTs. Prior research on representations of females and computing in mass media indicate that women have often been portrayed in low-status and low-skilled occupations and roles in relation to the technology.

Studies of print portrayals of computer advertisements found under-representation of women and extensive gender stereotyping. For example, Ware and Stuck (1985) found twice as many images of men than women in magazine advertisements for computers. Women were underrepresented as managers, experts, and repair technicians, and over-represented as salespeople, clerical employees, and sex objects. Marshall and Bannon's (1988) study of computer magazines found males comprised 68 percent of the individuals shown and that most females appeared not as the central figures in images, but as tokens mixed in larger groups of white males. Over 70 percent of the ads featured gender stereotyping of women in roles such as clerical employees or sex objects and men in managerial or executive positions. Similarly, in a sample of popular magazines and promotional materials about multimedia, Knupfer (1997) found most males were

portrayed as using the technology to achieve success at work, while most females were shown in subordinate roles and not using the technology to advance their careers.

Depictions of gender roles with ICTs in advertising in other media appear to follow similar patterns. Knupfer (1998) found that a sample of World Wide Web banner advertisements tended to portray women as sex objects and in low-skilled roles with information technology. When women appeared in the same or comparable type of advertisements as men, women were more often shown in subordinate roles than men. Comparable results emerged from a study of 351 prime-time television commercials aired during the 1998 season (White & Kinnick, 2000). Although the study found women were shown as computer users almost as often as men, women were significantly more likely than men to be depicted in non-professional occupations (such as secretary or telemarketer), and less likely than men to be portrayed as business professionals. Males were more likely to be shown as active computer users, while women were more likely to be portrayed as merely observing or passively standing by the machines. Thus, it is important to examine the distribution of jobs portrayed on sites aimed at involving girls with ICTs to see whether and how the sites are departing from the stereotypical occupational portrayals of women found in other media.

### *Research Questions*

Based on the literature on the gender gap in computing, this study poses four broad research questions. To what extent do web sites designed to engage girls with ICTs:

1. Address economic, cultural and civic uses of these technologies?
2. Feature women in a broad range of ICT-related occupations?
3. Foster a wide spectrum of information age knowledge and skills?
4. Differ by ownership (for-profit, not-for-profit) and editorial control (by adults, by girls, and by both adults and girls)?

We inquire into whether sites differ according to type of ownership because of longstanding concerns that commercial media are less likely to provide the kind of civic content needed for citizenship because doing so conflicts with the goal of profit-maximization (e.g., Baker, 1994). In addition, some research suggests that for-profit new media for women are more likely to construct women in narrow, traditional roles than nonprofit media (Strategies of Inclusion: Gender in the Information Society, 2004). We examine whether sites differed by type of editorial control because it is important for effective media design to know whether girls and adults bring different expectations and emphases to the use of ICTs.

## **Methods**

### *Sample*

The sampling strategy involved controlling for language and nationality of sites by limiting the sample to sites in English created by organizations based in the US and aimed primarily at US girls. Sites were eligible for the study if their mission statement, “about us” page, or homepage identified girls aged 12 to 17 years old as a target audience

and stated that part of their mission was aimed at engaging girls in using computer-based ICTs. ICTs included computers, electronic games, and the Internet, and sites were determined to be aimed at engaging girls with these media if they addressed girls as potential ICT users, designers, activists, donors, or community volunteers. Included in the sample were sections of sites devoted to cultivating girls' ICT knowledge and skills that were part of larger sites addressing a broader range of girls' interests (such as fashion, relationships, math, science, and so on). Excluded were web logs (blogs) and single news reports, few of which met the other criteria for the study regardless.

Because of the vastness and transience of the World Wide Web, as well as the lack of any comprehensive tool for searching all of the sites available there, it is unlikely that any study can present a full population of any kind of site (Stern, 2004). Thus, our findings can only be generalized to the sites in our sample. After experimenting with metasearch engines, search engines and directories, we found directories to be the most useful both at eliminating irrelevant hits and including lesser-known sites. Thus, on September 24, 2004 we searched the following major directories and leading directories for youth: [all Yahoo directories](#), [Google – Kids and Teens Directory](#), [Kid Sites.com – Girls Interests directory](#), [Cantufind – Teen Girls directory](#), [Ask Jeeves 4 Kids](#), [Kids Click](#), [Yahooligans](#), and Joan Korenman's [Websites for Girls directory](#). Search terms included computer and girl, gurl, and grrl; Internet and girl, gurl, and grrl; technology and girl, gurl, and grrl. Out of 808 initial hits, our final study population consisted of 35 sites, comprised of over 61,000 files amounting to about 2.2 gigabytes of data (see Table 1 for the list of sites.) Three coders coded the sites online between November 2004 and January 2005. Most of the sites were not updated often, so differences in the date that each site was coded likely had little impact on the sites' content.

#### *Measures*

Using the web site as the unit of analysis, the coding instrument measured the presence or absence on each site of content that addressed economic, cultural, and civic uses of ICT; a broad range of ICT knowledge and skills; information about ICT occupations; and site ownership and editorial control.

For ICT uses, coders looked for the presence of content on each site that fostered knowledge or skills dealing with economic, cultural or civic uses of ICT. A site was coded as imparting *knowledge* if it featured either written descriptions on the site or links from the site to information on other sites about each kind of ICT use. A site was coded as developing *skills* if it offered step-by-step instructions on how to use ICT or interactive activities on the site that allowed visitors to develop their abilities with ICT. For example, a site that described what an operating system does was coded as offering knowledge, while a site that featured an interactive game that allowed girls to tackle some basic computer programming tasks was coded as developing skills. A site that provided links to other sites that offered information about how to write html was coded as offering knowledge, while a site that itself gave a list of step-by-step instructions about how to write html was coded as fostering skills.

These uses of ICT were coded as *economic* if they included using the technology for a job or in clearly job-related education. *Cultural* uses referred to using ICT for self-expression, art, personal communication, or to engage with popular culture (such as for learning about fashion, music, films, or television programs). *Civic* uses were defined more broadly than in the traditional literature on media and political socialization, which

has been critiqued by Buckingham (1997) for defining civic activity narrowly as participation in electoral politics, and for defining political socialization as inculcating support for the political system rather than examining it critically. Instead, we adapted a wider definition of civic uses of ICT from Montgomery, Gottlieb-Robles & Larson (2004), which included use of ICT to participate in any of the following: voting on civic issues, community service, philanthropy, global affairs/international understanding, journalism and media production about public affairs, political activism, promoting social harmony and tolerance, and engaging with social and political issues directly relevant to ICT (including the gender gap in ICT use). Coders also determined the type of use that was *primarily* fostered on the site (based on an examination of the most prominent parts of the site: the mission statement or “about us” page and the home page).

Coders also measured the presence or absence on each site of a long list of ICT knowledge and skills derived from the literature on ICT literacy. These covered the five main types of knowledge and skills introduced earlier: technical, social-ethical, productivity-multimedia, communication, and research. See Table 2 for a list of the categories and definitions of each type of ICT knowledge and skill, as well as selected examples. If a site included any statement that conveyed even basic information about one of our categories, it was coded as offering knowledge. For example, although a site that merely mentioned the word “Dreamweaver” would not have been coded as offering knowledge about web authoring (in the larger category of productivity-multimedia), a site that included the statement “Dreamweaver is a program used to create web pages” would have been coded as providing this kind of knowledge.

Coders also searched for mentions of 10 ICT occupations by using Google’s keyword search function to search the sites for the words listed in bold-face in Table 3. The jobs were chosen to reflect a broad spectrum of occupational status in the industry, from executives to data entry operators, in order to examine whether the sites were departing from past mass media stereotyping of women in low-status ICT jobs.

Two additional defining features of the sites were also measured. Ownership was established according to whether a site’s domain name ended in .com (for for-profit sites) or in .edu, .gov, .org, or .net (for not for-profit sites). However, two sites that ended in .com but were created by nonprofit organizations and had no advertising on the site were coded as not for-profit, and one site was coded as unclear. Editorial control of a site was gauged by examining the ages of those identified in the “about us” or “credits” pages of the site as responsible for its design as well as by looking at interactive features (such as message boards). Sites were coded as created by adults if credits indicated that the designers were all 18 years of age and above and where less than two-thirds of the postings to interactive areas of the site were created by girls (17 and younger). Sites were coded as created by girls if the same indicators suggested that the site was created exclusively by a girl or girls. Sites were coded as created by both adults and girls if credits indicated that the site was created by at least one girl and at least one adult, and girl-created content made up at least one third of the site. For example, an e-zine created by adults that mostly featured girls’ writings was counted as created by both adults and girls.

*Intercoder reliability*

All coders used Internet Explorer 6.0 to minimize differences in the appearance of sites due to web browser software. After the three coders spent over 20 hours in training on the coding sheet, 7 websites (20 percent of the sample) were randomly selected for a test of intercoder reliability. With two exceptions, all of the variables reported here reached 80 percent agreement or above, as averaged across the 3 coders. Two of the coding categories for technology-related careers earned 71 percent agreement: the category for non-managerial media producer (including graphic or web designer, animator, writer, or game developer), and the category of technician/operator. Across all variables in the study, percent agreement averaged 91.7 percent. Because of the small study population of 35 sites, data from the sites used to test intercoder reliability were included in the full sample. Where there were coder disagreements on a given variable, the coding decision shared by two of the three coders was used in the final data set.

Although percent agreement may over-estimate reliability by not correcting for chance agreement, we used this statistic here because of the nature of our data. Many of the categories coded in the study were drawn from the theoretical literature pertaining to the ideal knowledge and skills needed for competency with ICT or civic education. Some of these types of knowledge and skills are absent from most or all websites—even in the complete sample of 35 sites. Because statistics like Krippendorff's *alpha*, Scott's *pi* or Cohen's *kappa* take into account not only the number of categories associated with a given variable, but also the probable frequency of use, when there is little variation in the sample due to the nature of the material being coded, or when all coders are in agreement, these statistics produce extremely low or indeterminate reliabilities.

Because of the small sample size, nonparametric statistics were used to analyze the data when we were exploring differences between groups or relationships between variables.

**Results***Uses of ICT*

We examined whether the sites varied in their emphasis on fostering cultural, economic, or civic uses of ICT, as measured through the knowledge and skills they taught users. The Friedman Test revealed a significant difference in the emphasis on cultural, economic, or civic uses across the sites on knowledge and skills (see Table 4). For both knowledge and skills, cultural uses were the dominant use of ICT promoted, followed by economic, and then civic uses.

Significant differences in the *main focus* of the site followed suit, with cultural uses taking precedence in 19 (54.3 percent) of the sites and economic in 16 (45.7 percent). None of the sites were coded as mainly fostering civic uses of ICT (Chi-Square(2, N = 35) = 17.87,  $p < .001$ ). In addition, regardless of what uses of ICT the sites prioritized, more sites offered knowledge (descriptions or links) than fostered skills (instructions or activities).

Ownership and editorial control were related to the main focus of the sites. Some 76.9 percent of the for-profit sites focused primarily on cultural uses, compared with 42.9 percent of the nonprofit sites. Fifty-seven percent of the nonprofit sites focused mainly on

economic uses of ICT, compared to 42.9 percent of the for-profit sites (Chi-Square(1, N = 35) = 3.78,  $p = .05$ ). Sites where adults shared editorial control with girls or where girls exerted full editorial control were more likely to focus primarily on cultural uses (76.9 percent did so, compared with 40.9 percent of the sites in which adults exerted editorial control). In contrast, the majority (59.1 percent) of the adult-controlled sites, mainly emphasized economic uses, whereas only 23.1 percent of the sites where girls exerted partial or full editorial control did so (Chi-Square(1, N = 35) = 4.27,  $p = .04$ ).

#### *Occupations*

We also examined whether websites included a variety of technical jobs across a continuum of skill levels, coding for the presence or absence of 10 different occupational categories across the web sites (see Table 5). Analysis using the Friedman Test showed that the frequency of jobs varied significantly. Higher-skilled jobs were most heavily represented. Occupations represented on fewer than half of sites were the lowest-skilled: technician/operator, customer support, and technical writer. Ownership type had little impact on the occupations featured on a site. Only one significant difference emerged: 84.6 percent of the for-profit organizations' sites included reference to careers involving sales, marketing or PR, compared with 47.6 percent of the non-profit organizations' sites (Chi-Square(1, N = 35) = 4.65  $p = .03$ ). Editorial control of the web sites was not significantly related to the types of careers mentioned.

#### *ICT Knowledge and Skills*

Table 6 presents data on the presence of the major types of ICT knowledge and skills on the web sites. Because a different number of items comprised the indexes for each set of knowledge and skills (communication, social/ethical, and so on; see Table 2 for all items), we computed a ratio based on the summative measure of types of knowledge and skills for each area divided by the number of items in the index. In order to test whether the variables are from the same distribution we used the Friedman Test, which calculates a mean rank for each variable over all the cases and then computes a test statistic that approximates a Chi-Square distribution. Comparison of these ratios revealed a significant difference in the categories of knowledge and skill that were found most often across the sites. The mean rankings from each variable reveal a two-tier emphasis of knowledge and skills: a top tier that was fostered by the most sites in the sample consisted of communication, social/ethical and technical knowledge and skills, while a second tier was comprised of civic, productivity/multimedia, and research. Neither ownership type nor editorial control by girls or adults bore a relationship with the comprehensiveness of knowledge and skills cultivated on the sites.

To understand the extent to which sites are emphasizing the different ICT knowledge and skills, we computed indexes for each type of knowledge and skills. As Table 7 reveals, the average site includes relatively little attention to each of the categories identified in the literature as needed for ICT literacy. For example, the average site included only two references to communication knowledge (out of a possible nine items in the index). Attention to skill areas in communication was even lower—the mean was 1.51. This pattern was consistent across all six areas of ICT knowledge and skills. The low mean scores in all categories indicate that the sites as a group are not

teaching a comprehensive range of knowledge and skills. In addition, mean scores show that sites were more likely to teach knowledge than skills in every category.

Table 8 gives a breakdown of each of the knowledge and skills measured across the sites, allowing us to see what the sites are emphasizing to girls. As noted earlier, communication knowledge and skills appeared on the most sites, led by items such as online games and message boards. Less attention was paid to polls, email, listservs, and chat rooms. Newer communication technologies were rarely referenced, including virtual reality, instant messaging, and text messaging.

Sites also devoted some attention to social and ethical knowledge and skills, led by collaboration/cooperation. Fewer sites addressed civility and privacy, and almost none dealt with intellectual honesty or intellectual property.

The technical knowledge and skills addressed most often on the sites tended to focus on software, such as defining software terms, designing software, and using software applications. By contrast, fewer sites focused on defining hardware terms, how to use hardware, and tinkering and troubleshooting hardware. Almost no sites covered anything having to do with designing hardware.

Productivity and multimedia knowledge and skills were led by web authoring, with somewhat less focus on digital photography and graphics and art. Only a handful of sites addressed word processing and none concerned spreadsheets.

The sites scored lowest on teaching civic and research knowledge and skills. Civic knowledge and skills taught by the sites consisted mostly of civic problem-solving or decision-making. Fewer sites fostered users' abilities to participate in civic life, collaborative learning on civic issues, opinion expression, and civic project-based learning. The sites mostly ignored deliberation and ICT regulation and policy, and no site addressed civic simulations. Research knowledge and skills were also neglected by most sites.

### *Qualitative Analysis*

Qualitative analysis helps explain why the few sites that did teach a more comprehensive range of knowledge and skills were doing so. Examination of the highest-scoring sites across the spectrum of knowledge and skills revealed that these sites were general interest communities that covered a wide range of topics. By contrast, sites focused exclusively on boosting girls' interest in science and technology did not pay much attention to cultivating a breadth of skills and knowledge. Ownership did not appear to influence comprehensiveness of knowledge and skills taught, as sites that scored best overall were a mix of commercial and noncommercial sites. However, editorial control did seem to play a role, as most of the top sites allowed adults and girls to share control by permitting girls to submit articles and message board postings extensively.

[Purple Pyjamas](#) offers an example of one of the most comprehensive sites. Run by a nonprofit organization (yet also supported by Google advertisements from national retailers), the site is an online community with main menu links to advice, entertainment, fun, creativity, humor, life, and opinion. The site's distinguishing feature is that it tries to maximize girls' contributions of writing and images on every page. Even the rotating images in the upper left corner of the homepage are of girls who use the site. Purple

Pyjamas cultivates technical and productivity-multimedia knowledge and skills mainly through its Tech Nerd column and Help Desk, which answer questions about computer use submitted by site users. This example question reveals a typical concern of site users and the level of technical sophistication of their queries:

I have been getting harassed on the internet on my blog. I track IPs, but have no way to read them/tell me who they are from. Know of any good sites that tell me where they come from, and can they tell me who the IP belongs to? Like their name, address, daytime telephone number? Your help would be greatly appreciated.

-Christine, 19 from United States

The site also fosters girls' communication knowledge and skills through its chat room and highly active message boards. Purple Pyjamas provokes civic discussion in the many political topics found in its Debate Forum message boards, and via a "Hit Me" page edited by a 20 year old who poses questions on controversial issues and solicits short essays from readers. The Debate Forum also raises social and ethical issues, for example through discussions about appropriate age limits on for using instant messenger software, privacy, and security.

We found [gURL.com](http://gURL.com) to be the best example of a site that fostered civic knowledge and skills, given that most sites did not do much in this regard. A general interest community and e-zine for teen girls, gURL.com is for-profit and advertiser-supported. Although advice, relationships, games and fashion are more prominent on the main menus on the site's homepage, civic content is woven lightly throughout the site. The site's widely-used "Shout-out boards" (message boards) allow girls to initiate and discuss a broad range of topics, including censorship and free speech. Another main menu item from the homepage encourages girls to "React" by taking part in polls and opportunities to debate politics and media ethics, sparked by provocative questions from the site's editors. For example, during the 2004 presidential campaign, the site posed the following query to readers:

Is "voting for old people"? (a t-shirt from Urban Outfitters). Urban Outfitters' new t-shirt campaign has stirred up controversy in what is shaping up to be a heated election year. While some critics say the t-shirt is "the wrong statement at the wrong time," Urban Outfitters claims the shirt speaks the truth about young people being jaded by (and left out of) the political process. What do you think? Does all of the politicians' talk of Social Security and prescription drug benefits for the elderly, tit-for-tat sound-biting, and their seemingly obligatory blow-dried hairdos turn young folk off from voting? If you could vote, would you?

The question garnered 285 responses from the site's users, including some long and thoughtful arguments for and against voting that raised questions about the fairness and inclusiveness of the political system, the efficacy of individual voters, and politicians' lack of attention to issues of importance to youth.

## Discussion

### *Uses*

The data gathered here indicate that sites designed to engage girls with ICT attempt to do so by emphasizing the technology's cultural and economic uses. For-profit and girl-created sites were more likely to focus mainly on teaching about cultural uses of ICT. Non-profit and adult-created sites were more likely to focus primarily on teaching about economic uses. The absence of any sites that mainly emphasize civic uses of technology is especially notable because coders recorded the presence anywhere on the site of such content and used a broader definition of civic activity than is commonly found in the literature on political socialization.

The small amount of attention to the civic aspects of technology in this sample may be explained by several factors. Ensuring that females can use ICT to participate equally in public life is a less common rationale for closing the gender gap in computing in the literature. This may reflect that American public culture tends to be more individualistic and market-driven than collective or civic in nature. In addition, the economics of commercial sites likely militate against a civic focus as it would be less likely to attract an audience of teen girls to deliver to advertisers. Many of the non-profit sites depend on grant money from the National Science Foundation and private foundations associated with the ICT industries, which tend to frame the problem of the gender gap as an economic one.

Although the economic, cultural, and civic uses of ICT all deserve to be represented on sites designed to engage girls with technology, it can be argued that the civic rationale especially deserves attention, for several reasons. First, although only a fraction of all girls (and of all boys for that matter) will be needed to work in the ICT industries, all girls will become citizens. Second, civic life increasingly requires the use of ICTs to engage with politics, government, and civil society (Cornfield, 2004), and those who are not comfortable engaging with public life online will be disadvantaged. Third, ICTs raise new policy and ethical issues (such as music file sharing) that especially affect youth's interests and opportunities. Fourth, the crisis of civic engagement by youth (Delli Carpini, 2000; Putnam, 2000) requires new means to reconnect young people with public life and some have suggested that new media could be an effective means for doing so (Montgomery, et al, 2004).

In this light, the sites in this sample appear to have missed an opportunity to engage girls with ICT via civic issues (such as the ethics of designing ICT to balance privacy and security concerns). The sites also have missed an opportunity to include ICT knowledge and skills in girls' civic toolkits. For example, just 17.1 percent of the sites fostered some knowledge of how to express one's opinion on civic issues (through petitions, polls, letters to the editor, article submissions, and so on). Political communication research shows American women are still significantly less likely than men to participate in politics by contacting a public official, discussing politics with friends and family, or trying to influence others' votes (Atkeson & Rapoport, 2003).

### *Occupations*

The sites for girls coded in this study were more likely to feature professional and managerial ICT occupations. Therefore, these sites generally succeeded at reversing the stereotypes found in ICT advertising that depicted women as lesser-skilled users of

technology. The sites provided girls with numerous role models who were shown as expert designers, managers, and users of ICTs.

Yet the emphasis on elite occupations means that there was little representation of lower-status technical jobs that may be reasonable for some girls to consider. Some of these jobs have also not been traditionally identified with females, such as technical writing and some kinds of technicians. Prior research on mass media has often found an absence of positive working class role models and occupations (Holtzman, 2004). Social learning theory suggests that realistic role models are the most powerful for media users, who are more likely to imitate a modeled behavior if they perceive the model as similar to themselves and their behavior is portrayed as valuable (Bandura, 1977). This suggests that web sites that show only elite occupations run the risk of generating a negative self-concept in some users who do not feel that they can meet the high standards set by role models on the site. An absence of women role models depicted as engaged in dignified yet lower-status ICT work may deter some girls from the field.

### *Knowledge and Skills*

As a group, the sites put more emphasis on knowledge than skills, often failing to provide girls with opportunities to develop their skills at using common online features. For example, 42.9 percent of sites offered instructions or activities having to do with message boards, 34.3 percent with games (mostly single-player rather than interactive, multi-player games), and 22.9 percent with polls; even fewer sites cultivated skills in using chat rooms (17.1 percent), listservs (8.6 percent), or simulations (0.0 percent) (see Table 8). Note that we coded sites as developing skills with these features even if they did not include the feature on the site itself, but merely offered an activity (such as a quiz) that allowed girls to polish their skills in using an interactive feature. The inattention to skills development may be attributable to cost and liability: maintaining many kinds of high quality interactive content typically requires greater staff time, and irresponsible use of some interactive features (such as chat rooms and message boards) may render sites liable for policing sexual harassment, defamation, invasion of privacy, and so forth. Further research is warranted into why these sites are not making greater use of interactivity, which is one of the web's defining features.

In addition, the sites scored surprisingly low on the indexes of knowledge and skills that are considered necessary for ICT literacy. Despite the fact that a single sentence offering basic information about one of our categories anywhere on an entire web site would have led us to code the entire site as fostering knowledge, and a brief set of instructions would have qualified the entire site as teaching skills, few sites offered a comprehensive range of ICT knowledge and skills. Even the mean for technical knowledge was disappointingly small, given the stated mission of the sites to engage girls with ICTs, often including spurring girls to consider careers in the field. These findings suggest that by focusing most often on fostering communication abilities, the sites are emphasizing what girls already know and do best on the web. Also worth noting was the low level of civic content, including attention to social, ethical and policy issues raised by ICTs themselves – a missed opportunity to engage girls with larger ethical and policy concerns that are relevant to their own use of the technology. Follow-up qualitative analysis of sites indicated that even when civic material was present it made up a small

proportion of the sites, which were mainly devoted to relationships, health, fashion, popular culture, and shopping. Furthermore, there was little crossover between ICT and civic content on these sites. More often, sections of sites devoted to boosting ICT skills were separate from areas of sites devoted to politics or community service. The most frequent area of crossover were media literacy issues, often focused on critiquing female body images in the media or the stereotype that girls cannot be feminine and interested in science and math at same time. Yet we found little attention to the specifics of ICT policy here.

### **Conclusion**

This study has offered the first systematic examination of how web sites designed to involve girls with technical learning and careers represent ICT. These sites represent one of many strategies aimed at closing the gender gap in computing, such as changing classroom pedagogy in technical courses to emphasize practical applications, reversing family dynamics that favor boys' computer use over girls', transforming the time-intensive and masculine workplace culture of the technology industry, challenging mainstream media stereotyping of computers as a male domain, and creating suitable computer games for girls (American Association of University Women, 2000).

Although a content study cannot determine what users are learning from these sites, this research raises questions about whether the sites in this sample can fulfill their purpose of involving girls with ICT, given the sites' current design. Although the sites are challenging mainstream media stereotypes of women as less technically competent with images of women role models in elite ICT jobs, the lack of lower level ICT role models may deter some girls from the field. Perhaps because of costs and legal concerns, most of these sites are not taking full advantage of the web's interactivity to offer skill-building instructions and activities online, instead offering up static content that is less likely to engage girls over time. As a group, the sites are not fostering the comprehensive range of skills and knowledge that girls need to be literate with ICTs. Content emphasizing proficiency with using ICTs for civic purposes is especially absent, and the sites pay little attention to social, ethical, and regulatory issues raised by ICTs themselves. In some ways, these sites now appear to be devoted to teaching girls what they already know. Many sites, especially those run by commercial organizations, emphasized the cultural uses of ICTs, areas where girls have apparently reached parity with boys. All sites focused most on developing girls' communication knowledge and skills, which prior research indicates are already quite strong. The scant technical information on the sites is more about software than hardware.

Content analysis of web sites is an emerging methodology. Although our sample reflects our best efforts to include a comprehensive list of US-based sites that attempt to engage girls with ICT, given the impossibility of locating a universe of sites using current search tools, we can only generalize our findings to the 35 sites examined here. Additionally, the large size of many sites presents the possibility of coders missing some content as they navigate through many pages. However, our intercoder reliability results offer some reassurance, as does our qualitative analysis, which yielded converging support for the quantitative results of the content analysis. Our coding for the presence or absence of a given content attribute anywhere on a web site is another limitation of the

study, but one that does not undermine its major findings. Our coding scheme did not distinguish between sites that included an attribute prominently or extensively and those that treated it marginally or briefly. Future studies could do so by offering measures of prominence (such as weighting content based on the number of links away from the homepage where the content is located) and extensiveness (such as the number of words, links, images, audio and video files devoted to a topic). Yet our major findings in this study would not be affected by using such metrics. The fact that the sites scored poorly on many measures even though a single mention of an ICT skill or civic use of ICT would have been enough for us to code the site as including them indicates that the bias of our research instrument was toward *overestimating* rather than underestimating the frequency of the kind of content we found missing on so many sites. In this case, a more fine-grained analysis would not challenge our findings.

We propose that it is time to rethink the gender gap and the rationale for closing it to include the civic uses of ICTs and the policy issues raised by them. This would involve sites addressing girls more as emerging information age citizens than as present consumers or future employees. It may be most important for sites to encourage girls to participate in democratic processes of designing, implementing and regulating what Lawrence Lessig (1999) has called “code.” By “code” Lessig means both the design of computer architecture (software, hardware, and systems) but also relevant codes of law, policy, and ethics. In this view, girls need hands-on experience writing both kinds of code. This study offers some elements that site designers can build upon to create more civic, comprehensive sites for girls. Sites appear to be most likely to feature content aimed at fostering girls’ comprehensive and civic ICT knowledge and skills when designers share editorial control with girls and when designers minimize the profit motive but assure a funding stream to support the site. As a nonprofit that features some less intrusive Google ads, Purple Pyjamas strikes an interesting balance. In addition, it would be advantageous for nonprofit organizations to pool their resources to develop more sophisticated sites that include features and activities that allow girls to build their skills, rather than simply posting “brochureware” sites that simply describe the sponsoring organization’s offline activities with girls.

This study suggests several directions for future research. Further work would be helpful on the economic forces shaping site design and maintenance. Interviews with site designers could illuminate barriers to more comprehensive and civic content, and spark thinking about new funding and content development models that would better support girls’ ability to see themselves as empowered by the full range of ICT knowledge and skills in the information age. Comparing sites aimed at engaging girls with ICT with those designed for all youth is also important for assessing the value of gender-specific sites. It is likely that girls visit many gender-neutral sites more often than they visit most of the sites in this sample. News sites, community sites, and the many sites designed to engage young people in voting, volunteering, and other civic activities may offer a broader range of ICT skills and knowledge as well as a greater civic content. However, the optimal research strategy may be to learn from girls themselves about how and where they develop their ICT abilities, especially for civic uses of technology, in the online world. This research could include both user studies and content studies of how girls interact with sites created by institutions (through message boards and other online submissions) and personal sites created by girls themselves. For example, some of the

most sophisticated learning about web design by girls appears to be happening on “graphic” and “blend” sites, which girls create to display their technical and artistic abilities with graphics programs, poetry, and blogging (Polak, forthcoming). Although these sites were not included in our sample because they are personal sites, they often comprise informal learning communities by joining in webrings that promote design competitions, tutorials, and trading feedback on design and technical issues. Some fine work has been done on how these sites provide spaces for girls to explore their identities (see also Mazzarella, 2005; Stern, 2002; Stern, 2004). The next step is to examine how girls’ own contributions to cyberspace can inform how web sites might boost girls’ civic engagement with ICT. Such research could suggest new ways to exploit the communicative lure of new media for girls to foster gender equity among those who will shape the future of these media, not simply as employees or consumers, but as citizens.

Table 2

*Categories of Analysis for ICT Knowledge and Skills*

<b>Category</b>	<b>Additional Coding Definition</b>	<b>Examples Knowledge (description or links) and Skills (instructions or activities) concerning how to define, use, or design:</b>
1. Technical		
<i>Hardware</i>	Any information or communication device with a chip or part of a network, or their internal components	PCs, PDAs, cell phones, TVs, servers, motherboards
<i>Software</i>	Any program running on a computer or network	Operating systems, applications, interfaces, compression and encryption programs, web browsers, network operating systems
<i>Tinkering and Troubleshooting</i>	Taking apart hardware or looking at software code to understand how it works; identifying or solving routine problems	Disassembly, identification, or repair of PC components
2. Social and Ethical		
<i>Collaboration and Cooperation (on noncivic issues)</i>	Supporting collaborative learning/welfare/happiness, or sharing experiences and advice	Mentors, professional and educational support groups and networking groups
<i>Civility</i>	Using civil discourse, not abusive language, when interacting with others	Chat room Netiquette
<i>Privacy</i>	Respecting and protecting privacy of others and oneself online (sites' privacy policies were excluded); not exploiting or impersonating other (real) people online	Protection of one's personal data online
<i>Intellectual property</i>	Respecting others' intellectual property	Not downloading copyrighted music
<i>Intellectual honesty</i>	Attributing others' work to them; avoiding plagiarism	Citing online sources
3. Productivity and Multimedia		
<i>Graphics, art, presentation software</i>	Creating graphics files	Microsoft Powerpoint
<i>Web authoring</i>	Creating web pages	Macromedia Dreamweaver
<i>Digital photography, video, audio, radio</i>	Producing these digital media	Internet radio
<i>Spreadsheets</i>	Manipulating numeric data	Microsoft Excel
<i>Word processing</i>	Manipulating written symbols	Microsoft Word
4. Communication		
<i>Email account</i>	Account for sending and receiving private messages via the Internet	Email accounts and features
<i>Listservs</i>	Program that distributes subscribers' contributions to common discussion to all other subscribers via e-mail	Listservs
<i>Chat room</i>	Space on web site for real-time	Chat rooms

	discussion of common topics	
<i>Online forums and submissions</i>	Any feature that allows users to post messages on a site	Message boards, online conferencing, user-written articles, letters to editor, advice columns, reviews on stable pages of site (not chat room, listserv, etc.)
<i>Instant messaging (IM)</i>	Real-time text-based communication via an IM program	AOL Instant Messenger
<i>Text messaging (SMS)</i>	Real-time messages sent via cell phone, PDA or pager	Text messaging
<i>Online interactive game</i>	Includes individual or multiplayer games	MUDs, puzzles
<i>Virtual reality (VR) environments</i>	Computer-generated environment with which users can interact using specialized peripherals such as data gloves or head-mounted displays	VR arcade games
<i>Poll (on noncivic issues)</i>	Users' expression of views as a vote" for pre-given response	Polls on favorite musicians
5. Research	How to use ICTs to learn about the world	Internet searching; graphing or modeling data with ICTs
6. Civic		
<i>Problem Solving and Decision-making</i>	Helping to solve real-world civic problems (not individual problems) or making decisions or taking actions that affect civic realm (not private, or individual self-help)	Mentoring girls to close the gender gap in computing
<i>Collaborative learning</i>	Learning with others about civic issues	Work with peers to research community problems online
<i>Project-based learning</i>	Learning about civic issues through online or offline projects	Research and presentations on environmental quality
<i>Simulations</i>	Learning through games or role-playing exercises based on a simplified model of a real-world situation	Exercises involving conflict resolution, diplomacy
<i>Speech</i>	Online or offline expression of opinion	Civic petitions, civic polls, letters to editor
<i>Deliberation</i>	Active <i>discussion</i> of policy options with others	Discussions in listservs, chat rooms, message boards
<i>Participation</i>	Connecting with adult role models or peers to engage in civic action online or offline	Fundraising drives, campaigns, demonstrations
<i>Regulation and policy</i>	How regulation or policy is shaped (by government, citizen groups, corporations, etc.); how cultural, economic, political factors shape ICT design, and vice-versa	Mutual influences of Internet and privacy, intellectual property, or free speech laws; law enforcement in cyberspace (against spam, identity theft)

Table 3

*ICT Occupations Coded*

---

- 1. Executive/Officer/Founder/President/Vice-President/Director**
- 2. Researcher/Professor:** Research Scientist (corporate, government or academic), Computer Science Professor, etc.
- 3. Manager/Leader/Webmaster:** Project Managers/Leaders/Directors, Webmasters, etc.
- 4. Administrator/Analyst/Engineer:** Network, Database, Systems, Web, etc.
- 5. Programmer:** Network, Database, Systems, Web, etc.
- 6. Graphic designer/Web designer/Animator/Writer/Game developer/Composer:** non-managerial media producers
- 7. Technical writer:** of manuals, documentation for users, etc.
- 8. Customer support/Computer support:** non-managerial call-center or on-site support, etc.
- 9. Sales/Marketing/Public relations/Community relations:** non-managerial
- 10. Technician/Operator:** installation, maintenance, repair, computer operator, data entry

Table 4

*Comparison of ICT Uses on Sites*

Type of Content	<u>ICT Use</u>			Chi-Square
	Cultural	Economic	Civic	
Knowledge	91.4% (32)	77.1% (27)	54.3% (19)	13.58***
Skills	65.7% (23)	37.1% (13)	31.4% (11)	13.05***

*Note.* Percents do not total 100% because each site can have multiple ICT uses. Frequencies in parentheses.

\*\*\*  $p < .001$

Table 5

*Frequency of Occupations on Sites*

Occupation	Percent of Sites
Executive/Officer/Founder/ President/Vice-President/Director	82.9
Researcher/Professor	80.0
Graphic designer/Web designer/Animator/ Writer/Game developer/Composer	77.1
Manager/Leader/Webmaster	71.4
Administrator/Analyst/Engineer	71.4
Sales/Marketing/Public relations/ Community relations	62.9
Programmer	51.4
Technician/Operator	42.9
Customer support/Computer support	11.4
Technical writer	8.6

*Note.* Chi-Square (9, N=35) = 121.04,  $p < .001$

Table 6

*Mean Ranks of ICT Knowledge and Skills*

ICT Knowledge and Skills	Rank
Communication	4.39
Social/Ethical	4.06
Technical	3.79
Civic	3.29
Productivity/Multimedia	3.10
Research	2.39

*Note.* Chi-Square (5, N=35) = 31.39,  $p < .001$

Table 7

*ICT Knowledge and Skills*

	Mean	<i>SD</i>	Items in Scale
Communication			
Knowledge	2.00	1.73	9
Skills	1.51	1.59	9
Social/Ethical			
Knowledge	1.20	1.05	5
Skills	.77	1.09	5

Participation	25.7 (9)	14.3 (5)
Regulation/policy	8.6 (3)	2.9 (1)

### About the Authors

[Chad Raphael](#) is an Associate Professor of Communication at Santa Clara University. His research interests include media and democracy, with a current focus on new media, gender, and the civic engagement of youth.

Address: Department of Communication, Santa Clara University, 500 El Camino Real, Santa Clara, CA 95053 USA

[Christine Bachen](#) is an Associate Professor of Communication at Santa Clara University. Her research interests center around young people's use of media, particularly within the context of family life. Her current research analyzes the civic content of youth-oriented websites and computer games, and its implications for new media designers.

Address: Department of Communication, Santa Clara University, 500 El Camino Real, Santa Clara, CA 95053 USA

[Kathleen-M. Lynn](#) is a communication consultant and researcher at Santa Clara University who has published on the effect of web site content design on young girls' attitudes toward computers in the *Journal of Educational Computing Research*. Her recent projects focus on information and communication technology content design, gender issues, and civic engagement. Her research interests center primarily on examining how young girls may be empowered by their use of new media.

Address: c/o Chad Raphael, Department of Communication, Santa Clara University, 500 El Camino Real, Santa Clara, CA 95053 USA

[Jessica Baldwin-Philippi](#) is an undergraduate student at Santa Clara University. Her research has centered upon websites aimed at teaching young girls about technology, as well as the civic content of media aimed at adolescents.

Address: c/o Chad Raphael, Department of Communication, Santa Clara University, 500 El Camino Real, Santa Clara, CA 95053 USA

[Kristen A. McKee](#) is an undergraduate student at Santa Clara University. Her professional experience includes interning at England's leading online young women's magazine, MyKindaPlace.com and the male teen online magazine MonkeySlum.com. Her research primarily focuses on the civic content found in current educational computer games.

Address: c/o Chad Raphael, Department of Communication, Santa Clara University, 500 El Camino Real, Santa Clara, CA 95053 USA
